# NORIP - Preliminary Haematology results

## **NORIP - Haematology**

60 Nordic laboratories

Denmark: 8

Finland: 26

Iceland: 1

Norway: 1

Sweden: 24

**Ca 1 800 reference persons**

**Ca 20 700 results**

## **Finland**

**Sample collection day**

Local measurement

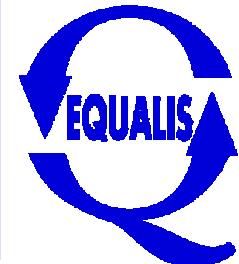

**Day 2**

Local and central  
measurement

## **Other countries**

**Sample  
collection day:**

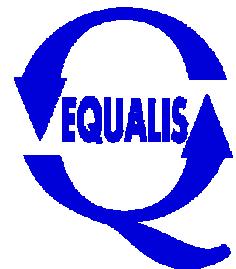

Local measurement

## NORIP - Preliminary Haematology results

| Country | Number of results |
|---------|-------------------|
| Denmark | 230               |
| Finland | 854               |
| Iceland | 78                |
| Norway  | 31                |
| Sweden  | 677               |

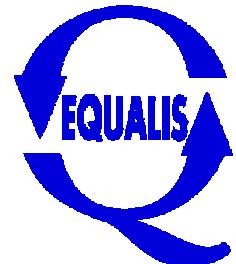

**Most influence on the common results from Finland and Sweden.**

## ***Inclusion criteria for reference persons***

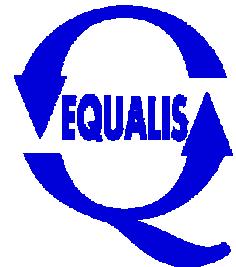

The reference individual should

- be feeling subjectively well
- have reached the age of 18
- not be pregnant or breast-feeding
- not have been an in-patient in a hospital nor have been subjectively dangerously ill during the last month
- not have consumed more than 2 measures of alcohol (24 g) in the last 24 hours
- not have given blood as a donor in the last five months
- not have taken prescribed drugs other than the P-pill or estrogens during the last two weeks
- not have smoked in the last hour prior to blood sampling

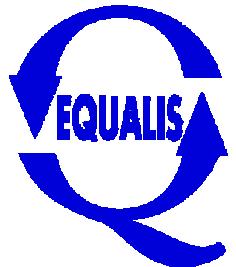

# Data handling

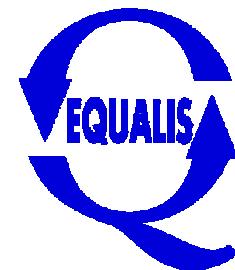

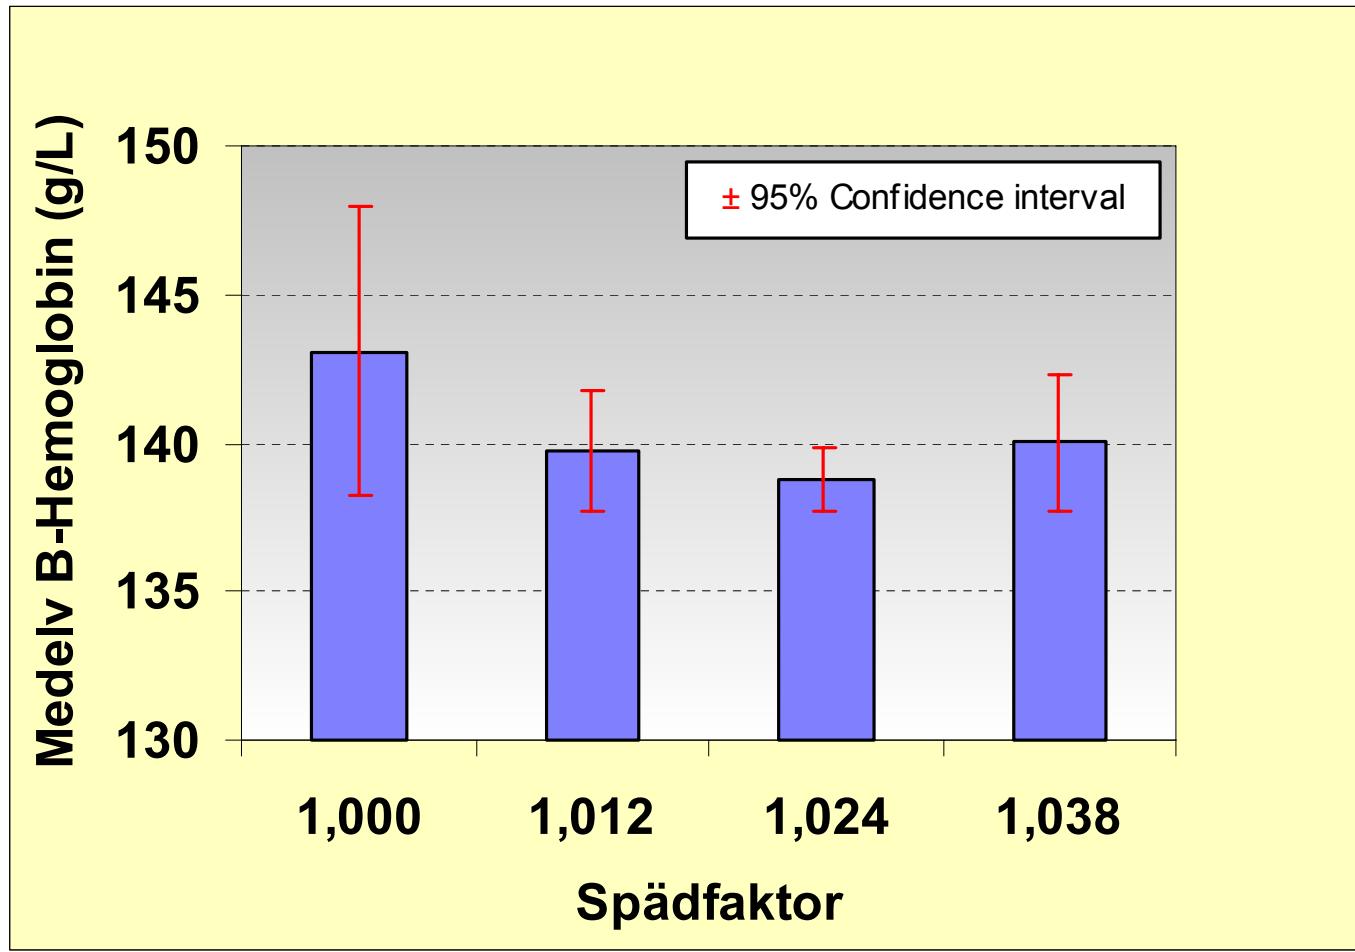

- 1. Collecting all results and reference person data into one common database.**
- 2. Correcting results for sample dilution.**
- 3. Excluding outliers.**
- 4. Test for partitioning.**
- 5. Nonparametric calculation of reference intervals**
  - robust, not influenced by small numbers of outliers.**
- 6. Checking dependence on country, instrument etc.**

## **Correcting results for sample dilution.**

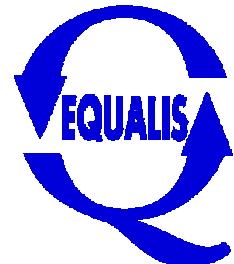

## Influence of the type EDTA-tube on the mean B-Hb ?

## **Exclusion rules for NORIP Haematology:**

- Single results have been excluded if they deviated more than +/- 5 SD from component mean.  
Exclusion according to this rule has been repeated until no result was excluded (twice needed).
- No results has been excluded for other reasons.

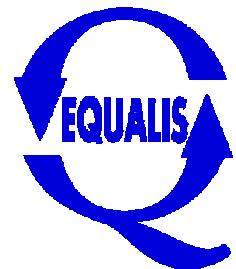

# Results deviating >5 SD, first round

## **Test for partitioning**

**Percentage (p) of subpopulation results outside the common reference limits determines if separate reference intervals for the subpopulations are recommended:**

- If the big p <3,2 % and the small p  $\geq$ 1,8 %  $\Rightarrow$   
Common reference interval is recommended = No partitioning.
- If the small p  $\geq$ 0,9 % but <1,8 % or  
the big p  $\geq$ 3,2 % but <4,1%  $\Rightarrow$   
Separate reference interval is possibly justified = No partitioning is proposed in NORIP Haematology.
- If the small p <0,9 % or the big  $\geq$ 4,1 %  $\Rightarrow$   
Separate reference interval is recommended = Partitioning.

## Objective Criteria for Partitioning Gaussian-distributed Reference Values into Subgroups

Ari Lahti,<sup>a</sup> Pan Hyacinth Pernoway,<sup>1,2</sup> Jason C. Barron,<sup>3</sup> Callum G. Fraser,<sup>3</sup> and  
Nils Jönssonius<sup>b</sup>

**Background:** The aim of this study was to develop new and useful criteria for partitioning reference values into subgroups appropriate to Gaussian distributions and to distributions that can be transformed to Gaussian distributions.

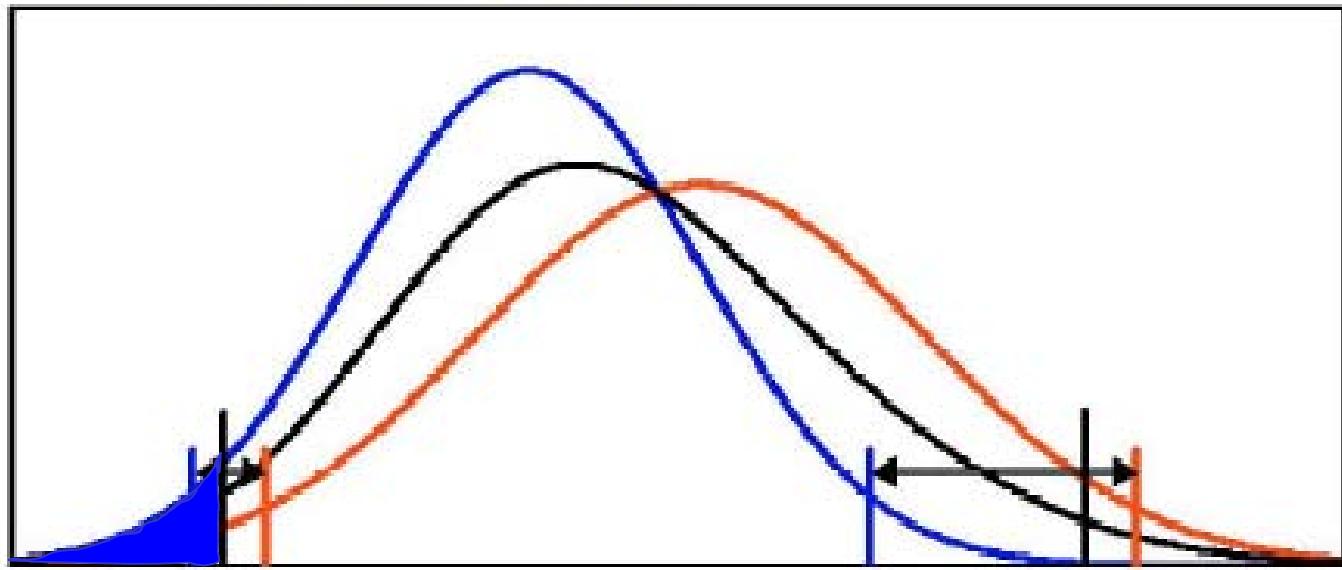

**Methods:** The proposed criteria relate to percentages of the subgroup areas over the reference areas of the standard distributions. Critical values suggested as partitioning criteria for these percentages were derived from analytical bias quality specifications for using reference reference intervals throughout a geographic area. An alternative partitioning criteria is the actual percentage, since some measurement mathematically impossible distances between the reference limits of the

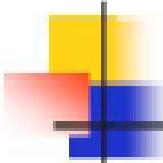

between these two values should be classified as marginal, implying that statistical considerations are required to make the final decision on partitioning. The correlation between the critical percentage and the critical distance was mathematically possible in the new model, whereas this correlation is rather approximate in the Gauss–Boye model because focus on the distances induces errors in this model unless high precision is hard to achieve. The application example suggested that they were needed to cover critical than the Gauss–Boye model.

**Conclusion:** New percentages and distance criteria to be used for partitioning Gaussian-distributed data have been identified. The distance criteria appear especially in both reference limit pairs at the tailings.

# New Model: Principle

Proportion (or distance criteria)

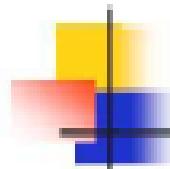

## New Model: Summary

- **Each end of the distributions is treated separately**
- **The proportion vs. distance curves are determined by using mathematical calculations**

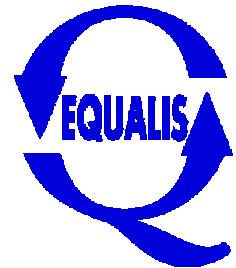

***Correlation between distance and proportion criteria for partitioning is good***

# Summary

- **The new model for distance criteria is**
  - more accurate than the Harris-Boyd model
  - easily adjustable to any new values for the critical proportions
- **Use of distance criteria should be restricted to gaussian distributions**
- **Proportion criteria are applicable to both gaussian and nongaussian distributions**

## **Nonparametric calculation of reference intervals**

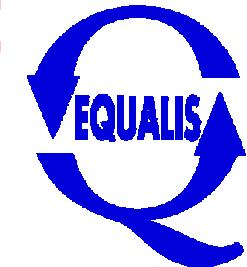

# NORIP - Preliminary Haematology results

**Non-parametric determination of reference limits.**

**Example 1:  
B-Hb, women,  
lower limit**

**Limit value at:  
2,5 % of  
totally 960  
results  
= 24,0**

## NORIP - Preliminary Haematology results

### Preliminary haematology reference intervals

| Analyte                                  | Gender subgroup | NORIP calculated | NORIP suggested |
|------------------------------------------|-----------------|------------------|-----------------|
| B-Leukocytes ( $10^9/L$ )                |                 | 3,47 – 8,81      | 3,5 – 8,8       |
| B-Thrombocytes ( $10^9/L$ ) <sup>#</sup> | Women           | 165 – 387        | –               |
|                                          | Men             | 145 – 348        | –               |
|                                          | All             | 153 – 367        | 145 – 390       |

\* Unit recommended by IFCC/IUPAC.

<sup>#</sup> For B-Thrombocytes the partitioning rules suggest separate low reference limits for women and men but the working group tends to propose a common reference interval for both genders.

# Suggestions

- All laboratories in the Nordic countries should be recommended by NFKK and the national societies to implement NORIP reference intervals
  - Reasonable time table - during 2003?
- Information material from NFKK and the national societies concerning information about NORIP to be presented for
  - Laboratories and clinicians
  - Patients and other end users
  - Professional journals
  - Professional meetings

Thanks !

These presentations are made  
with good support from

Gunnar Nordin, Pål Rustad,  
Ari Lahti, Helge Erik Solberg and the working  
group for NORIP Haematology
